

Gentlemen:

I am definitely in favor of RM-10352. My reason for this is that there appears to be widespread confusion present about using wide-band modes below 1843KHz in the 160M band. Even though the ARRL band plan for 160M has been well publicized, there appear to be many who still think it is only a suggestion which can be ignored as personal circumstances or beliefs dictate. Narrow modes as we know are more efficient in band usage and do not require as much power to communicate a given distance as a wide-band mode. Having a specified plan as called for by the FCC for the other bands will greatly reduce the conflicts which we encounter on this band from time to time.

Thanks for considering my comments in this matter!

Yours truly,

Sam Leslie, W4PK
